<http://pld.ttu.ee/~trkal/E/F2.txt>

You have a small database that you must read into a structure (this part is done for you) and then add 1 extra record into structure.

You are given exactly enough memory to read the initial database. To read the extra data, more memory must be allocated inside the *addData(DATA*)* function using *realloc* function. You should not edit the input function, the main function nor the structure.

To prove your active participation – please send what you have done at 14:00 and your final code at 15:15.

Before next week – Make a new function so that a person can be searched inside the structure by ID code and allow the user to change the name.
