### Component/Unit Testing (I)

- ✓ A unit of testing
  - Functions in procedural programming languages such as C, Fortran, ...

```

Test driver  F1(int x1, y1) {
              .....
              F2(x1+1, y1-1);
            }

Test unit    F2(int x2, y2) {
              .....
              F3(x2+2, y2-1);
            }

Test stub    F3(int x3, y3) {
              .....
            }
  
```

5

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

### Component/Unit Testing (II)

- ✓ Require knowledge of code
  - High level of detail
  - Deliver thoroughly tested components to integration
- ✓ Stopping criteria
  - Code Coverage
  - Quality

6

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Component/Unit Testing (III)

- ✓ Test case
  - Input, expected outcome, purpose
  - Selected according to a strategy, e.g., branch coverage
- ✓ Outcome
  - Pass/fail result
  - Log, i.e., chronological list of events from execution

TALLINNA TEHNIKAKÜLKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

7

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Integration Testing (I)

- ✓ Interactions among units (assembled components that must be tested and accepted previously)
  - Import/export type compatibility
  - Import/export range errors
    - F1 calls F2 with a parameter of array
    - F1 assumes array of size 8, while F2 assumes an array of size 10
  - Import/export representation
    - F1 calls F2 with a parameter Elapsed\_time
    - F1 thinks in seconds, while F2 thinks in milliseconds

TALLINNA TEHNIKAKÜLKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

8

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Integration Testing (II)

- ✓ Strategies for integration testing
  - Top-down
    - Stubs are needed
  - Bottom-up
    - Drivers are needed
  - Big-bang
  - Functional
  - Drivers & stubs have to be tested as well!

TALLINNA TEHNIKAKÜLKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

9

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## System Testing (I)

- ✓ Tests the overall system (the integrated hardware and software) to determine whether the system meets its requirements
- ✓ Focuses on the use and interaction of system functionalities rather than details of implementations
- ✓ Test cases derived from specification
- ✓ Should be carried out by a group independent of the code developers
- ✓ Should be planned with the same rigor as other phases of the software development
- ✓ Use-case focus

TALLINNA TEHNIKAKÜLKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

10

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## System Testing (II)

- ✓ Non-functional testing
- ✓ Quality attributes
  - Performance, can the system handle required throughput?
  - Reliability, obtain confidence that system is reliable
  - Timeliness, testing whether the individual tasks meet their specified deadlines
  - etc.

TALLINNA TEHNIKAKÜLKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

11

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Acceptance Testing

- ✓ User (or customer) involved
- ✓ Environment as close to field use as possible
- ✓ Focus on:
  - Building confidence
  - Compliance with defined acceptance criteria in the contract

TALLINNA TEHNIKAKÜLKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

12

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

### Re-Test and Regression Testing (I)

- ✓ Conducted after a change
- ✓ Re-test aims to verify whether a fault is removed
  - Re-run the test that revealed the fault
- ✓ Regression test aims to verify whether new faults are introduced
  - Re-run all tests
  - Should preferably be automated

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

13

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

### Re-test & Regression Testing (II)

- ✓ Development versus maintenance
  - Development costs: 1/3
  - Maintenance costs: 2/3
- ✓ Testing in maintenance phase
  - How can we test modified or newly inserted programs?
    - Ignore old test suites and make new ones from the scratch or
    - Reuse old test suites and reduce the number of new test suites as many as possible

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

14

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

### Accessibility of Testing

- ✓ White box testing (structural testing, program-based testing)
- ✓ White box testing is a test case design method that uses the control structure of the procedural design to derive test cases. Test cases can be derived that
  - guarantee that all independent paths within a module have been exercised at least once,
  - exercise all logical decisions on their true and false sides,
  - execute all loops at their boundaries and within their operational bounds, and
  - exercise internal data structures to ensure their validity.

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

15

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

### Accessibility of Testing (II)

- ✓ Black box testing (functional testing, specification-based testing)
  - Assumes that the program is unavailable or testers do not want to look at the details of the program
    - Derives test cases from the requirements of the program
    - Controls and observes the program only through external interfaces
    - Ideally done by independent test group (not original programmer)
- ✓ Grey box testing

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

16

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

### Program-Based Testing (I)

- ✓ Main steps
  - Examine the internal structure of a program
  - Design a set of inputs satisfying a coverage criterion
  - Apply the inputs to the program and collect the actual outputs
  - Compare the actual outputs with the expected outputs
- ✓ Limitations
  - Cannot catch omission errors
    - What requirements are missing in the program?
  - Cannot provide test oracles
    - What is the expected output for an input?

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

17

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

### Program-Based Testing (II)

Apply input → Program → Observe output

Validate the observed output against the expected output

Who will take care of test oracles?

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

18

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Statement Coverage

- ✓ Statement coverage of a set of test cases is defined to be the proportion of statements in a unit covered by those test cases.
- ✓ 100% statement coverage for a set of tests means that all statements are covered by the tests. That is, all statements will be executed at least once by running the tests.

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

19

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Branch Coverage

- ✓ Branch coverage is determined by the proportion of decision branches that are exercised by a set of proposed test cases.
- ✓ 100% branch coverage is where every decision branch in a unit is visited by at least one test in the set of proposed test cases.

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

20

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Example – Branch coverage

What branch coverage is achieved by **ABG, ACDFG, ACEFG**?

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

21

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Example – Branch coverage

What branch coverage is achieved by **ABG, ACDFG, ACEFG**?

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

## Example – Branch coverage

What branch coverage is achieved by **ABG, ACDFG, ACEFG**?

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

24

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

### Example – Branch coverage

What branch coverage is achieved by **ABG, ACDFG, ACEFG**?

4 in total.

4 covered

So  $4/4 = 100\%$  branch coverage

TALLINNA TEHNIKAKÜKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

25

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

### Path Coverage

- ✓ Path coverage is determined by assessing the proportion of execution paths through a unit exercised by the set of proposed test cases.
- ✓ 100% path coverage is where every path in the unit is executed at least once by the set of proposed test cases.
- ✓ 100% path coverage is achieved by an ideal test set. As we saw the other week, it is all but impossible or infeasible in most programs of any size.

TALLINNA TEHNIKAKÜKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

26

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

### Example – Path coverage

What path coverage is achieved by **ABG, ACDFG, ACEFG**?

### Example – Path coverage

What path coverage is achieved by **ABG, ACDFG, ACEFG**?

$3/3=100\%$

TALLINNA TEHNIKAKÜKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

29

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

### Coverage

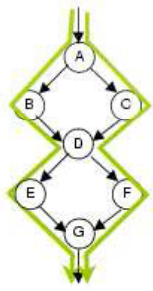

- ✓ It is possible to have 100% statement coverage without 100% branch coverage
- ✓ It is possible to have 100% branch coverage without 100% path coverage
- ✓ 100% path coverage implies 100% branch coverage and 100% branch coverage implies 100% statement coverage

TALLINNA TEHNIKAKÜKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

30

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

### An example

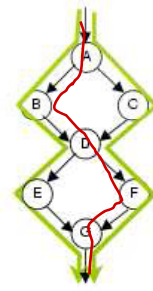

- ✓ Test cases covering ABDEG and ACDFG cover 4/4 branches (100%) and 7/7 statements (100%)
- ✓ They, however, only cover 2/4 paths (50%).

TALLINNA TEHNIKAKÜLKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

31

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

### An example

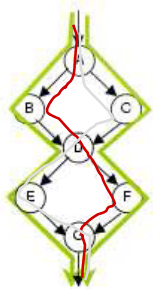

- ✓ Test cases covering ABDEG and ACDFG cover 4/4 branches (100%) and 7/7 statements (100%)
- ✓ They, however, only cover 2/4 paths (50%).
- ✓ 2 more tests are required to achieve 100% path coverage
  - ABDFG

TALLINNA TEHNIKAKÜLKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

32

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

### An example

- ✓ Test cases covering ABDEG and ACDFG cover 4/4 branches (100%) and 7/7 statements (100%)
- ✓ They, however, only cover 2/4 paths (50%).

TALLINN UNIVERSITY OF TECHNOLOGY

33

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

### Loop Testing

- ✓ It is usually impossible or infeasible to test all paths in a program involving loops
- ✓ Basis Path Testing
  - Zero path: Test zero iterations of the loop body (Guard is negated by loop initialisation)
  - One path: Test a single iteration of the loop body (Good idea to try for 100% path coverage of loop body if loop body is not iterative)
  - Does not consider maximum iteration termination in many cases
  - Does not consider combinations of loop body paths in successive iterations

TALLINNA TEHNIKAKÜLKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

34

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

### Mutation testing

- ✓ Create a number of mutants, i.e., faulty versions of program
  - Each mutant contains one fault
  - Fault created by using mutant operators
- ✓ Run test on the mutants (random or selected)
  - When a test case reveals a fault, save test case and remove mutant from the set, i.e., it is killed
  - Continue until all mutants are killed
- ✓ Results in a set of test cases with high quality
- ✓ Need for automation

TALLINNA TEHNIKAKÜLKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

35

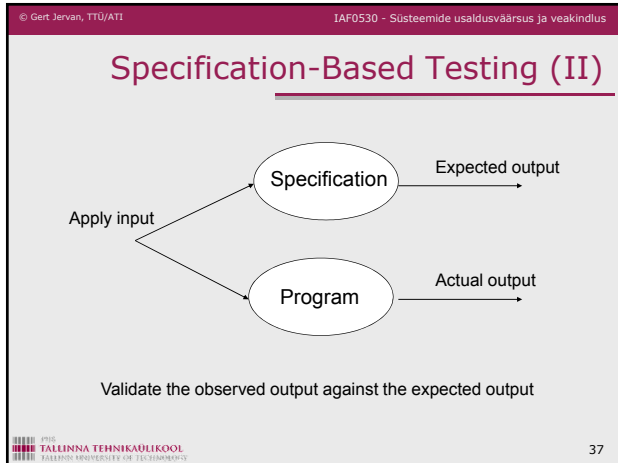

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

### Specification-Based Testing (I)

- ✓ Main steps
  - Examine the structure of the program's specification
  - Design a set of inputs from the specification satisfying a coverage criterion
  - Apply the inputs to the specification and collect the expected outputs
  - Apply the inputs to the program and collect the actual outputs
  - Compare the actual outputs with the expected outputs
- ✓ Limitations
  - Specifications are not usually available
    - Many companies still have only code, there is no other document.

TALLINNA TEHNIKAKÜLKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

36

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Object-Oriented Program Testing

- ✓ Unit testing for OO Programs
  - A class is a set of variables and member functions
  - 50% of member functions are just 10 lines of code
  - A class is often a unit of testing in C++ or Java
- ✓ Integration testing for OO Programs
  - Rule of thumb in OO development
    - Make a large number of small classes in a bottom-up fashion
  - There are several relationships between classes
    - Association, aggregation, inheritance, concurrency

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

38

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Steps to Testing Nirvana

- ✓ Think about potential problems as you design and implement. Make a note of them and develop tests that will exercise these problem areas.
  - Document all loops and their boundary conditions, all arrays and their boundary conditions, all variables and their range of permissible values.
  - Pay special attention to parameters from the command line and into functions and what are their valid and invalid values.
  - Enumerate the possible combinations and situations for a piece of code and design tests for all of them.
  - GIGO - what happens when garbage goes in?  
*Kernighan, Pike, "The Practice of Programming"*

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

39

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Steps to Testing Nirvana

- ✓ Test systematically, starting with easy tests and working up to more elaborate ones.
  - Often leads to "bottom up" testing, starting with simplest modules at the lowest level of calling
  - When those are working, test their callers
  - Document (and/or automate) this testing so that it can be repeated (regression testing) constantly as the code grows and changes.

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

40

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Steps to Testing Nirvana

- ✓ Within a module, test *incrementally* as you code
  - Write, test, add more code, test again, repeat
  - The earlier that errors are detected, the easier they are to locate and fix.
  - Testing is not only concerning code
    - Documents and models should also be subject to testing

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

41

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Tricks of the Trade

- ✓ Test boundary conditions.
  - loops and conditional statements should be checked to ensure that loops are executed the correct number of times and that branching is correct
  - if code is going to fail, it usually fails at a boundary
  - check for off-by-one errors, empty input, empty output

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

42

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## The Budget Coverage Criterion

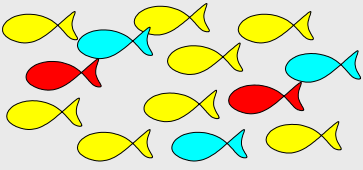

- ✓ A common answer to "when is testing done"
  - When the money is used up
  - When the deadline is reached
- ✓ This is sometimes a rational approach!
  - Implication 1: Test selection is more important than stopping criteria per se.
  - Implication 2: Practical comparison of approaches must consider the cost of test case selection

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

43

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Test Selection vs. Test Adequacy

Mutation Testing Example

- ✓ Red fish = real program faults (unknown population)
- ✓ Blue fish = seeded faults (e.g., mutations) or representative behaviors (known population)
- ✓ Adequacy: count blue fish caught, estimate red fish
- ✓ Misuse for selection: use special bait to catch blue fish

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

44

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Test Selection: Standard Advice

- ✓ Specification coverage is good for selection as well as adequacy
  - applicable to informal as well as formal specs
- ✓ + Fault-based tests
  - usually ad hoc, sometimes from check-lists
- ✓ Program coverage last
  - to suggest uncovered cases, not just to achieve a coverage criterion

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

45

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## The Importance of Oracles

- ✓ Much testing research has concentrated on adequacy, and ignored oracles
- ✓ Much testing practice has relied on the "eyeball oracle"
  - Expensive, especially for regression testing
    - makes large numbers of tests infeasible
  - Not dependable
- ✓ Automated oracles are essential to cost-effective testing

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

46

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Sources of Oracles

- ✓ Specifications
  - sufficiently formal (e.g., SCR tables)
  - but possibly incomplete (e.g., assertions in Anna, ADL, APP, Nana)
- ✓ Design, models
  - treated as specifications, as in protocol conformance testing
- ✓ Prior runs (capture/replay)
  - especially important for regression testing and GUIs; hard problem is parameterization

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

47

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## What can be automated?

- ✓ Oracles
  - assertions; replay; from some specifications
- ✓ Selection (Generation)
  - scripting; specification-driven; replay variations
  - selective regression test
- ✓ Coverage
  - statement, branch, dependence
- ✓ Management

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

48

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Design for Test: Principles

Adapted from circuit and chip design

- ✓ **Observability**
  - Providing the right interfaces to observe the behavior of an individual unit or subsystem
- ✓ **Controllability**
  - Providing interfaces to force behaviors of interest
- ✓ **Partitioning**
  - Separating control and observation of one component from details of others

TALLINNA TEHNIKAÜLIKOOL

### Remarks by Bill Gates

17th Annual ACM Conference on Object-Oriented Programming, Seattle, Washington, November 8, 2002

- ✓ "... When you look at a big commercial software company like Microsoft, there's actually as much testing that goes in as development. We have as many testers as we have developers. Testers basically test all the time, and developers basically are involved in the testing process about half the time...
- ✓ "... We've probably changed the industry we're in. We're not in the software industry; we're in the testing industry, and writing the software is the thing that keeps us busy doing all that testing."

TALLINNA TEHNIKAÜLIKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

Department of computer Engineering  
ati.ttu.ee

### Remarks by Bill Gates (cont.)

- ✓ "...The test cases are unbelievably expensive; in fact, there's more lines of code in the test harness than there is in the program itself. Often that's a ratio of about three to one."
- ✓ "... Well, one of the interesting questions is, when you change a program, ... what portion of these test cases do you need to run?"

TALLINN UNIVERSITY OF TECHNOLOGY

53

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Real-Time Systems

- ✓ **Real-Time System** – system, which is required to adhere not only functional but also tempoal requirements ("timing constraints" or "deadlines")
- ✓ **RT-systems:**
  - Hard RT-systems
  - Soft RT-systems

TALLINNA TEHNIKAÜLIKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

54

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Real-Time Systems Testing

- ✓ Inherits issues from concurrent systems
  - Problems becomes harder due to time-constraints
    - More sensitive to probe-effects
    - Timing/order of inputs become more significant
- ✓ Adds new potential problems
  - New failure types
    - E.g. Missed deadlines, Too early responses...
  - Test inputs → Execution times
  - Faults in real-time scheduling
    - Algorithm implementation errors
    - Assumption about system wrong

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

55

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Real-Time Systems Testing

- ✓ Pure time-triggered systems
  - Deterministic
  - Test-methods for sequential software usually apply
- ✓ Fixed priority scheduling
  - Non-deterministic
    - Limited set of possible execution orders
  - Worst-case w.r.t timeliness can be found from analysis
- ✓ Dynamic (online) scheduled systems
  - Non-deterministic
    - Large set of possible execution orders
  - Timeliness needs to be tested

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

56

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Testing Timeliness

- ✓ Aim : Verification of specified deadlines for individual tasks
  - Test if assumptions about system hold
    - E.g. worst-case execution time estimates, overheads, context switch times, hardware acceleration efficiency, I/O latency, blocking times, dependency-assumptions
  - Test system temporal behavior under stress
    - E.g. Unexpected job requests, overload management, component failure, admission control scheme
- ✓ Identification of potential worst-case execution orders
- ✓ Controllability needed to test worst-case situations efficiently

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

57

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Testing Embedded Systems

- ✓ System-level testing differs
  - Performed on target platform to keep timing
- ✓ Closed-loop testing
  - Test-cases consist of parameters sent to the environment simulator
- ✓ Open-loop testing
  - Test-cases contain sequences of events that the system should be able to handle

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

58

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Distributed Real-Time Systems

- Distributed applications
  - On a single cluster
  - On several clusters
- Motivation
  - Reduce costs: use resources efficiently
  - Requirements: close to sensors/actuators
- Distributed applications are difficult to...
  - Analyze (e.g., guaranteeing timing constraints)
  - Design (e.g., efficient implementation)

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

59

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Testing Distributed RT-Systems

- ✓ Problems with distributed systems:
  - Increased complexity
  - The difficulties of observing and monitoring
  - Non-reproducible behaviour of the system
  - The lack of synchronized global clock and, consequently, the difficulties of unambiguously defining a "global state"

TALLINNA TEHNIKAKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

60

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Testing Distributed RT-Systems

- ✓ Observability
  - What?
  - How?
  - When?
- ✓ Controllability
- ✓ Auxiliary outputs, interactive debuggers

TALLINNA TEHNIKAKÜLKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

61

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Observability Issues

- ✓ Probe effect (Gait,1985)
  - "Heisenbergs's principle" - for computer systems
  - Common "solutions"
    - Compensate
    - Leave probes in system
    - Ignore
- ✓ Must observe execution orders
  - Gain coverage

TALLINNA TEHNIKAKÜLKOOL  
TALLINN UNIVERSITY OF TECHNOLOGY

62

## Controllability Issues

- ✓ To be able to test correctness of a particular execution order we need control
  - Input data to all tasks
    - Initial state of shared data/buffers
  - Scheduling decisions
    - Order synchronization/communication between tasks

## Testing Distributed RT-Systems

- ✓ **Reproducibility**
  - *Regression testing* – retesting after errors have been corrected
    - errors truly corrected
    - no new errors
  - A distributed system may be non-reproducible due to nondeterminism in it's hardware, software or operating system

## Testing Distributed RT-Systems

- ✓ **Obtaining reproducibility**
  - Language-based approach
    - Enforcing the identified scenarios during execution
    - All solutions rely on source code transformations
  - Implementation based approach
    - Collecting all missing information during an execution of the system
    - Event histories or traces

## Testing Distributed RT-Systems

- ✓ Disadvantages of implementation based approach:
  - Special dedicated HW (to monitor)
  - Large amount of information
  - Can we guarantee the correctness of reply?
  - Modified programs. What happens with event histories. Are they still valid?
  - Event histories can be used only on target systems

## Testing Distributed RT-Systems

- ✓ Interdependence of Observability and Reproducibility
  - Not independent!
  - Probe effect

## Testing Distributed RT-Systems

- ✓ **The host/target approach**
  - Host - development
  - Target - execution
- ✓ Testing on the host system is used for (functional) unit testing and preliminary integration testing (as much as possible)
- ✓ Testing on the target system involves completing the integration test and performing the system test. Also performance, timing, etc.

## Testing Distributed RT-Systems

- ✓ Environment simulation (for target system test)
  - Simulated v. real environment:
    - Safety and/or cost considerations.
    - "rare event" situations
    - More control over simulated environment
    - Easier to obtain responses and test results
  - On-line v. off-line test data generation:
    - Need to generate large amounts of input data
    - Runs cost-effectively

## Testing Distributed RT-Systems

- ✓ Representativity
  - Only small number of real-world scenarios can be anticipated and taken into account.
  - Only a fraction of those anticipated real-world scenarios can be tested due to the combinatorial explosion of possible event and input combinations.
- ✓ Test coverage - how many of the anticipated real-time scenarios can be or have been covered by corresponding test scenarios.

## Self-checking distributed systems

- ✓ Run-time checking of the effects of faults on system behaviors needs to be carried out continuously.
- ✓ Reliability – the key to distributed SW quality

## Self-checking distributed systems

- ✓ Aspects to design correct SW:
  - Reliability with which the SW specifications are adequately described and correctly implemented in the actual implementation.
  - Run-time checking

## Self-checking distributed systems

- ✓ Fault-secure systems are systems, where faults may be enforced not to propagate.
  - Faults are not visible or have no effect
  - Faults are visible, but it's easy to notice that an error exists
- ✓ Self-testing – System is self testing when there exists testing behavior, occurring during the run-time behavior of the system, such that this fault will be propagated to the output and it's easy to notice, that there is a fault (out of predefined set of values)
- ✓ System is self-checking for a set of faults, if whatever a fault belonging to this set, it is fault-secure and self-testing.

## Self-checking distributed systems

- ✓ Worker-observer
  - the *worker* is a classical implementation of the system behavior
  - the observer is a given redundant implementation whose outputs are comparable with the outputs of the worker.
- ✓ To obtain observing behavior:
  - Redundancy
  - Reference
  - Visibility
    - Worker cooperates with the observer
    - Worker behavior can be spied by the observer

## Self-checking distributed systems

- ✓ A *formal observer* is a subsystem designed to check distributed behaviors where:
  - Its sw is independent of the specific protocols to be checked in the considered system;
  - Its data are defined by the protocols to be checked and this data can be formally specified and verified.

## Self-checking distributed systems

- ✓ Design of the system
  - write a description of the behavior of the system to be implemented;
  - Implement the system itself, i.e., the worker;
  - From the description of the worker, select (based on experience) that part of the behavior which should be observed and write a formal model of it.

TALLINN UNIVERSITY OF TECHNOLOGY

76

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Self-checking distributed systems

- ✓ The system is *quasi self-checking* if
  - It is an observer-worker system
  - The observer is a formal observer.
- ✓ For "real-life" only part of the system will be modelled.
- ✓ Formal model must be able to
  - Express simplified specifications of distributed systems
  - Support verification procedures
  - Be able to act as a basis for implementing the observer.

## Few testing criteria exists for concurrent systems

- ✓ Number of execution orders grow exponentially with # synchronization primitives in tasks
  - Testing criteria needed to bound and selecting subset of execution orders for testing
- ✓ E.g. Branch / Statement coverage not sufficient for concurrent software
  - Still useful on serializations
  - Execution paths may require specific behavior from other tasks
- ✓ Data-flow based testing criteria has been adapted
  - E.g. define-use pairs

78

© Gert Jervan, TTÜ/ATI IAF0530 - Süsteemide usaldusväärsus ja veakindlus

## Determinism vs. Non-Determinism

- ✓ **Deterministic systems**
  - Controllability is high
    - input (sequence) suffice
  - Coverage can be claimed after single test execution with inputs
  - E.g. Filters, Pure "table-driven" real-time systems
- ✓ **Non-Deterministic systems**
  - Controllability is generally low
  - Statistical methods needed in combination with input coverage
  - E.g.
    - Systems that use random heuristics
    - Behavior depends on execution times / race conditions

## Test execution in concurrent systems

- ✓ **Non-deterministic testing**
  - "Run, Run, Run and Pray"
- ✓ **Deterministic testing**
  - Select a particular execution order and force it
  - E.g. Instrument with extra synchronizations primitives
    - (No timing constraints make this possible)
- ✓ **Prefix-based Testing (and Replay)**
  - Deterministically run system to a specific (prefix) point
  - Start non-deterministic testing at that specific point
